1 Exercise: Webpack Entry

Now, we'll start to see the files webpack will create for us. Again, start by `cd` into `webpack-content`.

- Add an `index.js` file to the `client` directory
- Add the entry point attribute to the webpack config `./src/client/index.js`

In `webpack.config.js`, within `module.exports`, add:

```
entry: './src/client/index.js'
```

- Add an alert to the `index.js` so we can see it run

Here's one option here:

```
alert('I exist!')
```

- Build webpack

```
npm run build
```

If you want to also see the app in action, use `npm start` as well.

- Check for a `dist` folder - look in the `main.js` file for the alert you added

Need to try viewing the app? Use these to view or stop the app.
